Alabama Sexually Transmitted Diseases: Epidemiology Data Book, 2004- 2013

Alabama Sexually Transmitted Diseases: Epidemiology Data Book, 2004-2013 presents statistics and trends for sexually transmitted diseases (STDs) in Alabama through 2013. This data book is intended as a reference document for policy makers, program managers, health planners, health care providers, researchers, communities, and others who are concerned with the public health implications of these diseases.

Chlamydia	
Gonorrhea	
Syphilis	

This Data Book, Alabama's STD Epidemiology, provides an opportunity to review trends in these diseases within the state.

In 2013, the following trends existed with regard to the three most commonly reported bacterial STDs in Alabama:

- Infectious syphilis (primary, secondary, and early latent syphilis) incidence rates continued to increase yearly – a trend which began in the last quarter of 2007. Although infectious syphilis remains relatively rare overall, the disease remained at epidemic levels among men who have sex with men.
- Gonorrhea incidence decreased in 2011 by 6%. Gonococcal disease primarily remains concentrated within non-white populations from major urban centers.
- Incident chlamydia infections continue to increase with more provider screenings. Increased case reporting is reflective of increased electronic laboratory reporting and/or access to screening with more sensitive laboratory testing. Moreover, recent research has revealed gaps in our understanding of what proportion of chlamydia cases will progress to complications such as epididymitis, pelvic inflammatory disease, ectopic pregnancy, infertility, or chronic pelvic pain.¹

Highlighted on pages 16 –116 is an overview of are STDs trends by Public Health Area (PHA). Alabama is divided into eleven public health areas to facilitate coordination, supervision and development of public health service. Area offices are responsible for developing local management programs of public health services and programs particularly suited to the needs of each area.

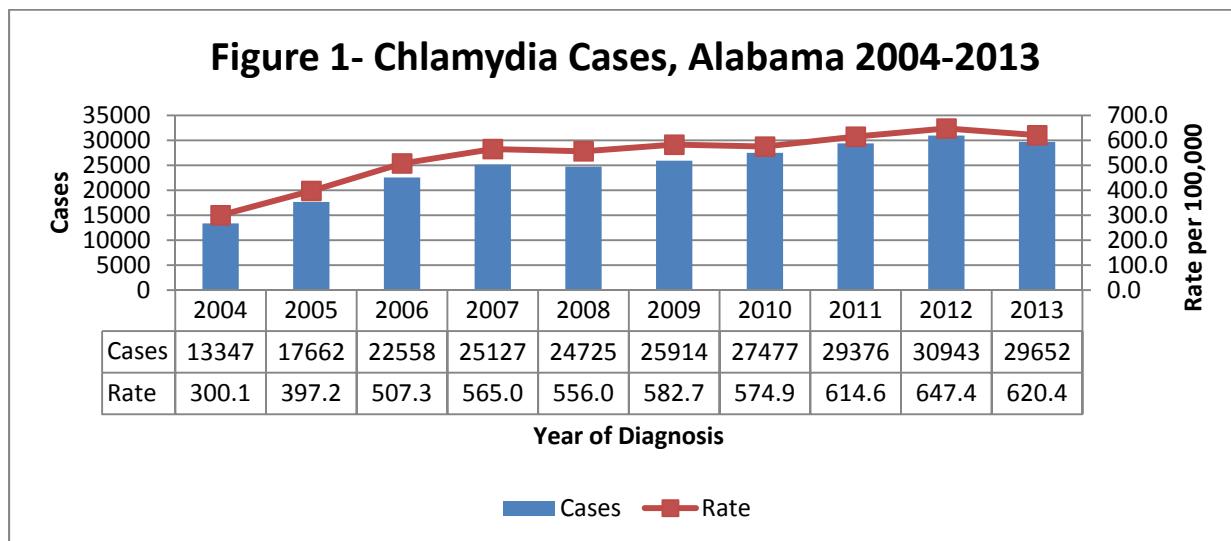

The intended audience for this annual surveillance report includes clinicians, laboratory professionals, community organizations, local public health departments, policymakers, and researchers who are interested in the sexual health and well-being of residents of Alabama. We welcome feedback and invite you, the reader, to begin by thinking in terms of disease statistics, but end by acting in terms of health promotion.

Anthony Merriweather, MSPH, Director, Division of STD Prevention & HIV/AIDS Surveillance

¹ Gottlieb et al. Summary: the natural history and immunobiology of chlamydia trachomatis genital infection and implications for chlamydia control. Journal of Infectious Diseases 201:S190-204, 2010.

CHLAMYDIA

Reports of chlamydia cases in 2013 were down 4.2% from 2012, 30,943 to 29,652 , respectively. The number of chlamydia cases in 2013 reflects a case rate of 620.4 cases per 100,000 population (Figure 1).

Although chlamydia cases have decreased, the demographic profile of the disease has remained stable. Chlamydia cases are traditionally higher for women than men. Chlamydia screening programs focus on women because of their increased risk of severe outcomes from untreated infections.

Chlamydia Cases and Rates by Gender, Race/Ethnicity and Age Group, Alabama 2009-2013 (Table1)

Of the 29,652 cases reported in 2013, 72.6% were among women. The chlamydial infection rate was 863.2 cases per 100,000 population compared to men at 355.9 cases per 100,000 population

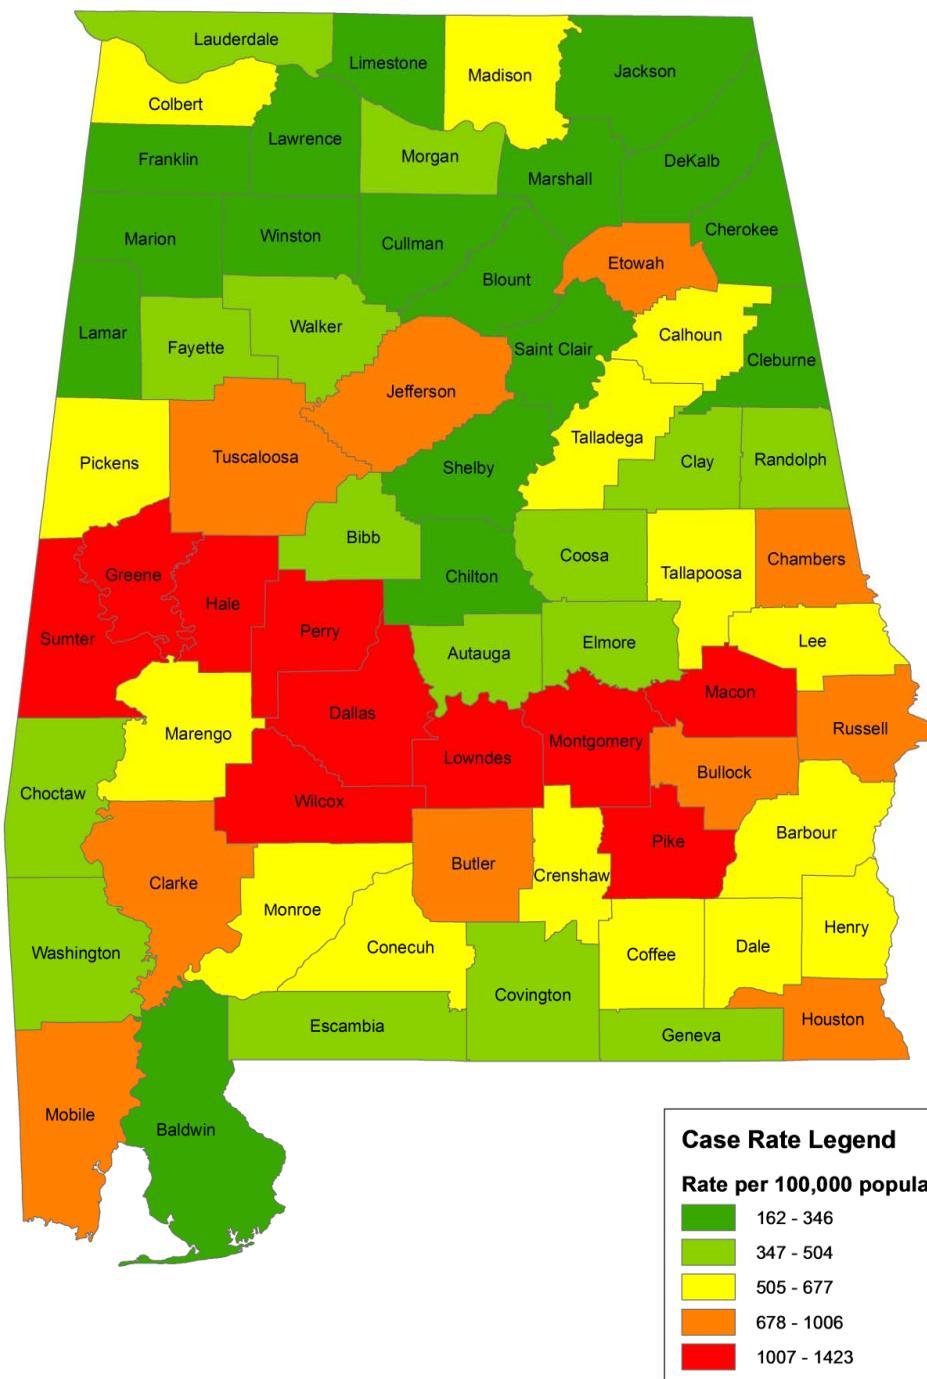

Blacks comprise the majority of chlamydia cases reported . Although Blacks comprised nearly 26% of Alabama population, they comprised 50.3% of the reported chlamydia cases in 2013. Blacks (1,192.4 cases per 100,000) had the highest reported case rate compared to Whites (147.2 cases per 100,000) and Hispanics (107.2 cases per 100,000). This demonstrates a significant burden of disease within the Black population. Among all race/ethnic and gender groups, Black females have consistently accounted for the majority of chlamydia cases. In 2013, Black females represented over 33.8% of the reported chlamydia cases followed by Black males (16.5%), White females (11.9%) and White males (4.3%). Nearly 74% of all reported chlamydia cases in 2013 were between 15 – 24 years of age. The chlamydia case rate among persons age 15-24 was 3,226.0 cases per 100,000 population.

Public Health Areas with high rates of Chlamydia are scattered across the state and are not limited to highly populated counties. County level rates for Alabama in 2013 are illustrated in PHA Map 1.

Chlamydia Case Rate 2013

GONORRHEA

In 2013, the number of reported gonorrhea cases decreased by 10.8% from the previous year (9,385 to 8,376 cases). This corresponds to a case rate of 175.2 cases per 100,000 population (Figure 2).

Gonorrhea Cases and Rates by Gender, Race/Ethnicity and Age Group, Alabama 2009-2013, Table 2

Gonorrhea cases were higher in women in 2013 compared to men by nearly 1,000 cases. Blacks were disproportionately affected by gonorrhea. In 2013, Blacks represented 61.4% of gonorrhea cases reported. The rate of gonorrhea cases among Blacks (411.3 cases per 100,000 population) was nearly seventeen times greater than case rate reported for Hispanics (23.3 cases per 100,000 population).

Although Black females had the highest number of reported gonorrhea cases (2687), the case rate was highest for Black males at 421.5 cases per 100,000 population. Over 65.1% of gonorrhea cases reported in 2013 were among persons 15-24 years of age.

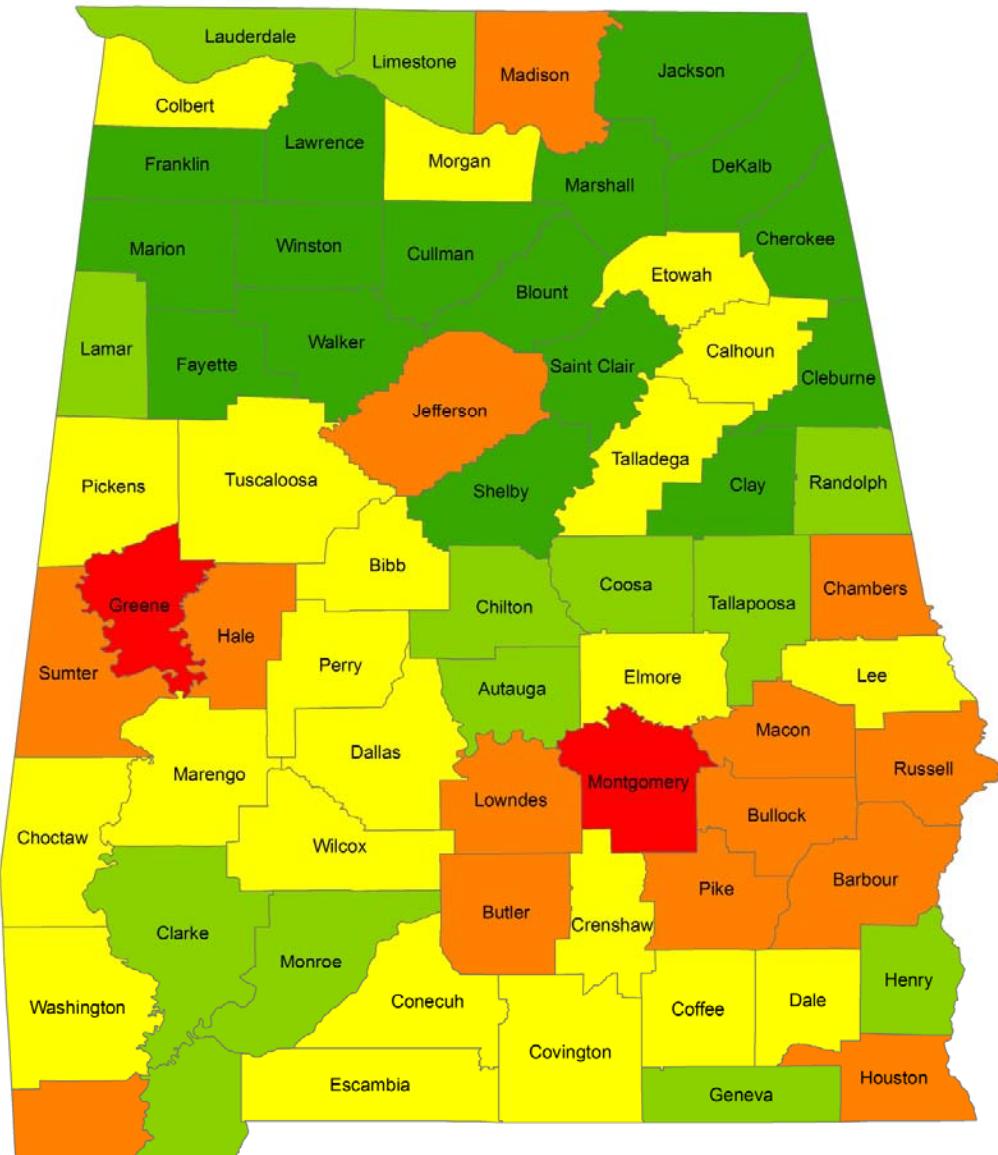

Areas of high rates of gonorrhea are scattered across the state.

SYPHILIS

Alabama reported 185 cases of Primary and Secondary (P&S) Syphilis in 2013, 15.5% decrease from the 219 cases reported in 2012. The overall state rate for P&S syphilis in 2013 was 3.9 cases per 100,000 population. The decrease in cases is a reflection of the diligent work of Disease Intervention Specialists (DIS) with collaboration from medical providers and STD/HIV Prevention partners across the State (Figure 3).

P&S Syphilis Cases and Rates by Gender, Race/Ethnicity and Age Group, Alabama 2009-2013,
Table 3

Blacks accounted for 62.3% of the P&S syphilis cases reported in 2013. The rate of P&S syphilis cases among Blacks was 9.1 cases per 100,000 population which is seven times the rate for Whites (1.3 cases per 100,000 population). Over 42% of the P&S cases reported in 2013 among Blacks were residents of Jefferson (24), Mobile (21), Montgomery (20) and Madison (12) counties. The number and case rate of P&S cases has traditionally been higher among males. The P&S case rate for males in 2013 was 7.1 cases per 100,000 population compared to females at 0.9 cases per 100,000.

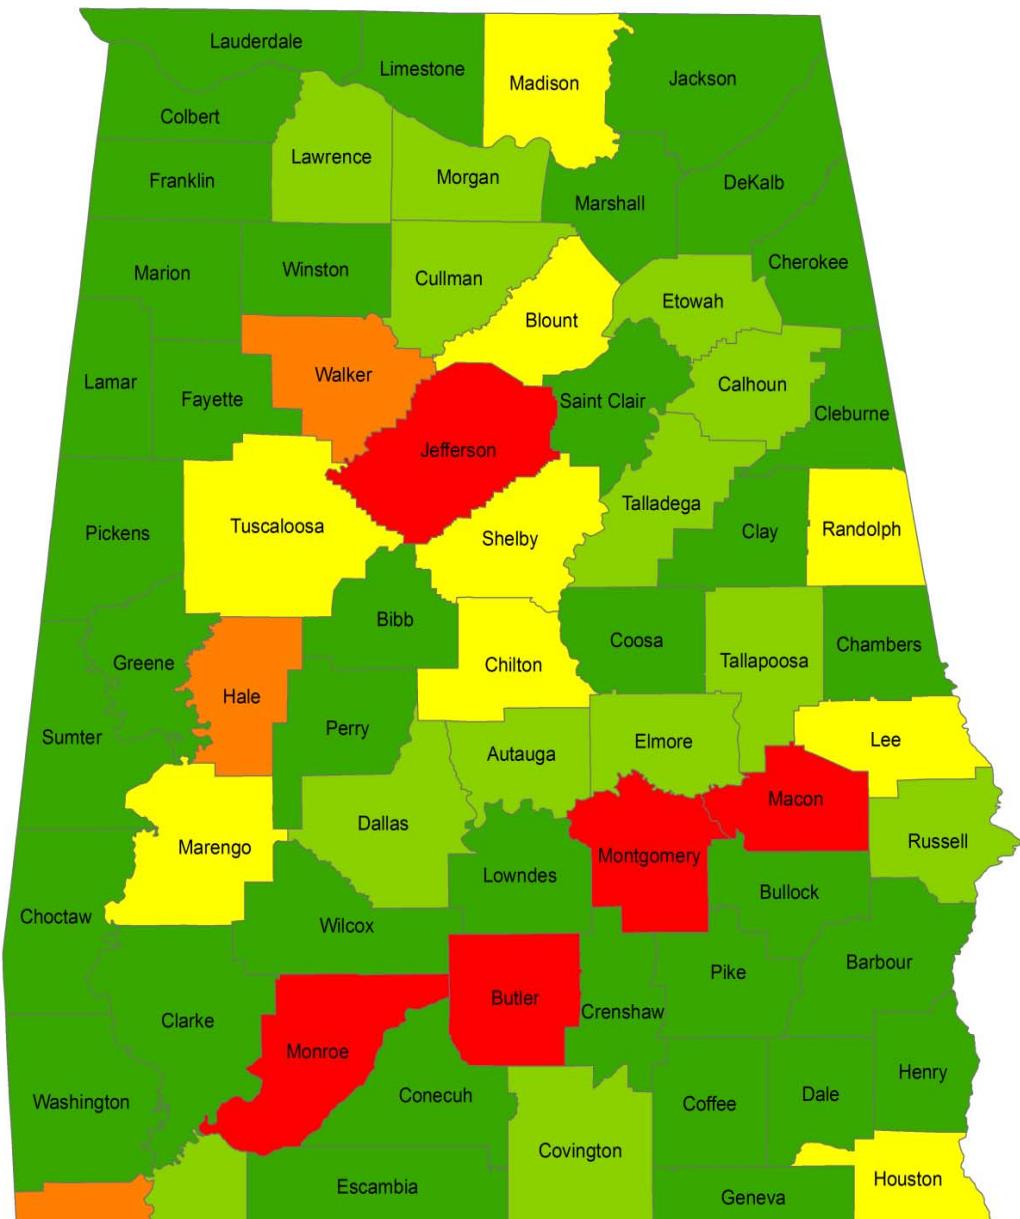

The number of P&S syphilis cases reported in 2013 was highest among Black males (97), White males (40) and Black females (17). The case rate of reported P&S syphilis cases in 2013 was higher among Black males (16.6 cases per 100,000 population), Black females (2.9 cases per 100,000 population) and White males (2.5 cases per 100,000 population) (Table 3).

Jefferson (52), Madison (16), Montgomery (23), and Mobile (27) counties represented 64.5% of the reported cases in 2013. These counties had a case rate of 7.9 cases per 100,000 population (Jefferson County), 4.8 case per 100,000 population (Madison County), 6.5 cases per 100,000 population (Mobile County) and 10.0 cases per 100,000 population (Montgomery County). County level rates for Alabama in 2013 are illustrated in PHA Map 3.

6.6 - 10.0

Early Latent Syphilis in Alabama 2004 - 2013

The number of Early Latent Syphilis (EL) cases has fluctuated over the past 10 years.

However, since 2008 the number of EL cases has declined by 56.2%. In 2013, Alabama reported 194 early latent syphilis cases with a corresponding rate of 4.1 per 100,000 population (Figure 4).

The number of cases remains highest among Blacks. In 2013, Blacks accounted for 75.3% of the EL cases reported. In 2013, the rate of EL syphilis reported among Blacks (11.7 cases per 100,000 population) was nearly 4.5 times and 15 times the rate of those reported for Hispanics (2.7 cases per 100,000 population) and Whites (0.8 cases per 100,000 population), respectively.

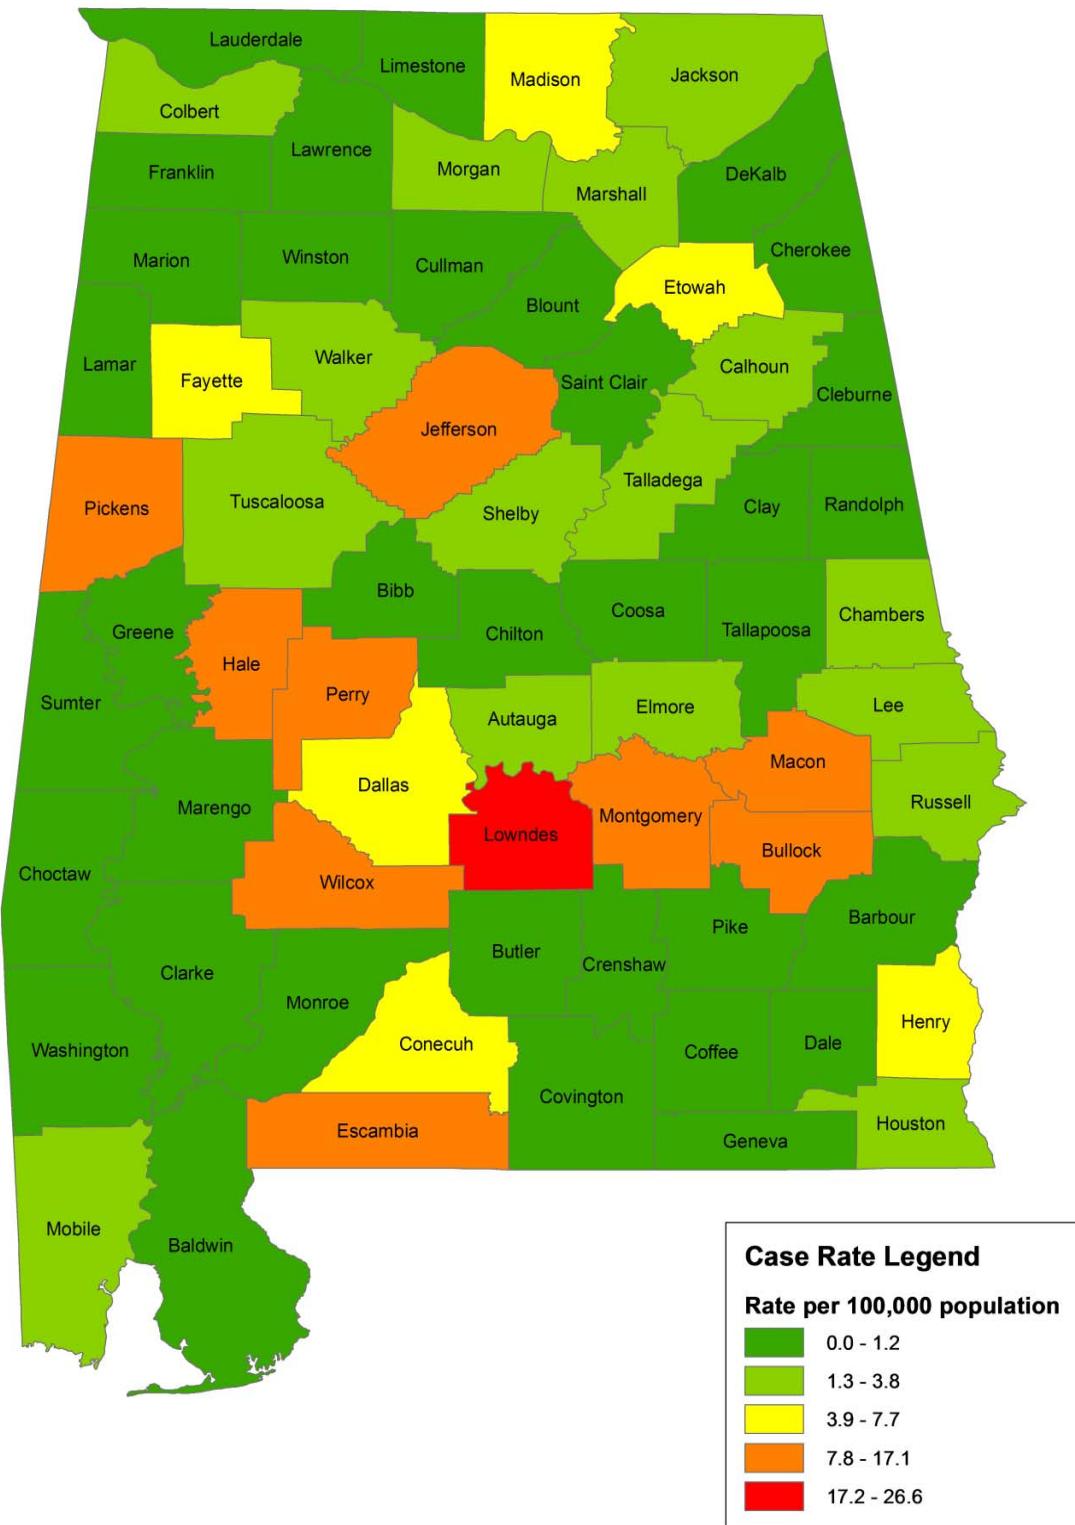

The number of EL syphilis cases remains highest among Black males and Black females. In 2013, a total of 107 EL syphilis cases were reported among Black males. The case rate of reported EL syphilis cases in 2013 was higher among Black males (18.4 cases per 100,000 population) and Black females (6.7 cases per 100,000 population) (Table 4).

Jefferson County reported the largest number of EL syphilis cases (66) in 2013 followed Montgomery (25), Madison (16) and Mobile (12) counties. These counties accounted for 61.3% of the EL syphilis cases reported in 2013 and 61.6% of the cases reported among Blacks. Furthermore, Jefferson County has consistently reported the highest number of EL syphilis cases over the past ten years. The population case rate for Jefferson County in 2013 was 10.0 cases per 100,000 population. County level rates for Alabama in 2013 are illustrated in PHA Map 4.

EL Syphilis Case Rate 2013

STI Epidemiology

By Public Health Area

PUBLIC HEALTH STRUCTURE

Alabama is divided into eleven geographically distinct public health areas (PHAs) with the two most populous counties representing single PHAs. Each area has authority to provide core public health services to the community including HIV counseling and testing, sexually transmitted disease (STD) screening and treatment, maternal and child health, vaccine preventable immunizations, family planning, home health services, and adult health clinics.

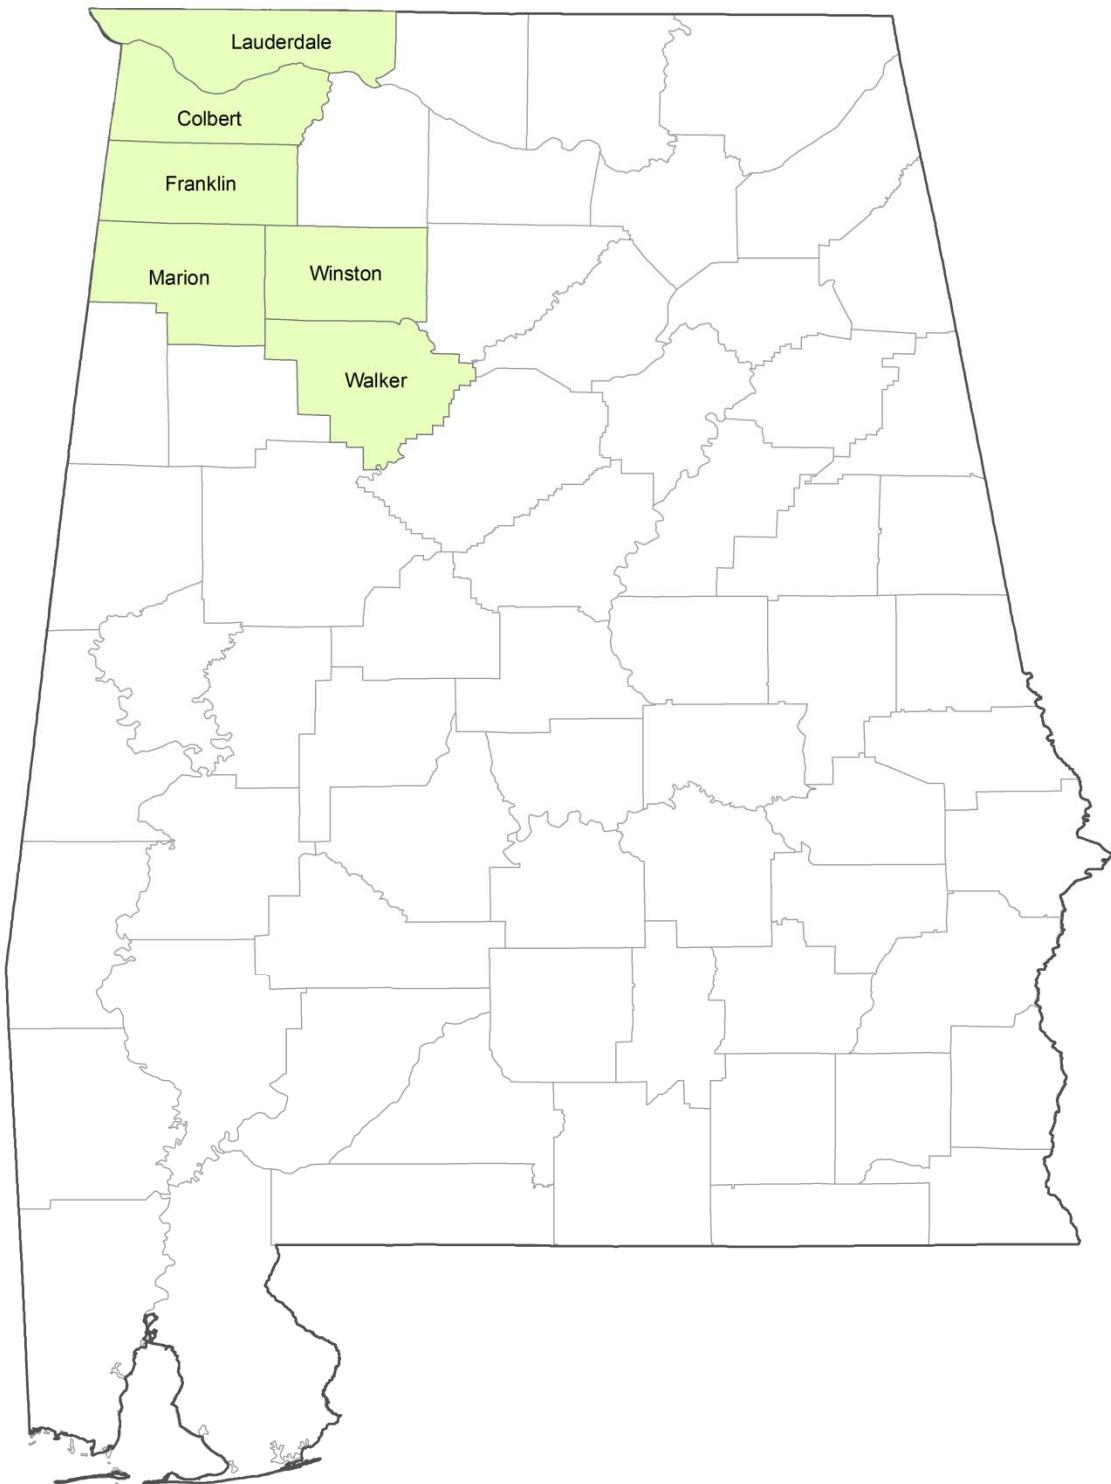

PHA 2 has the largest combined population with 798,074 residents while PHA 4 (Jefferson County) has the second largest population with 658,466 residents. PHA 7 has the smallest population with only 141,789 residents and is part of the agricultural Black Belt region. PHA 7 has the lowest percentage of White residents (34%) and the highest percentage of African American residents (51%) in Alabama. Statewide, the number of persons reported as White ranges from 34% in PHA 7 to 86% in PHA 1. Alabama's African American population ranges from only 8% in PHA 1 to 51%, in PHA 7. Hispanics comprise about 4% of Alabama's population (range 1% in PHA 7 – 6% in PHA 5).

Following the 2010 census, Alabama ranked 42nd nationally in per capita income with 23% of the population living in poverty. Alabama's agricultural Black Belt region (Bullock, Butler, Choctaw, Crenshaw, Dallas, Greene, Hale, Lowndes, Macon, Marengo, Perry, Pickens, Sumter, and Wilcox counties) has the highest poverty and unemployment rates in the state.

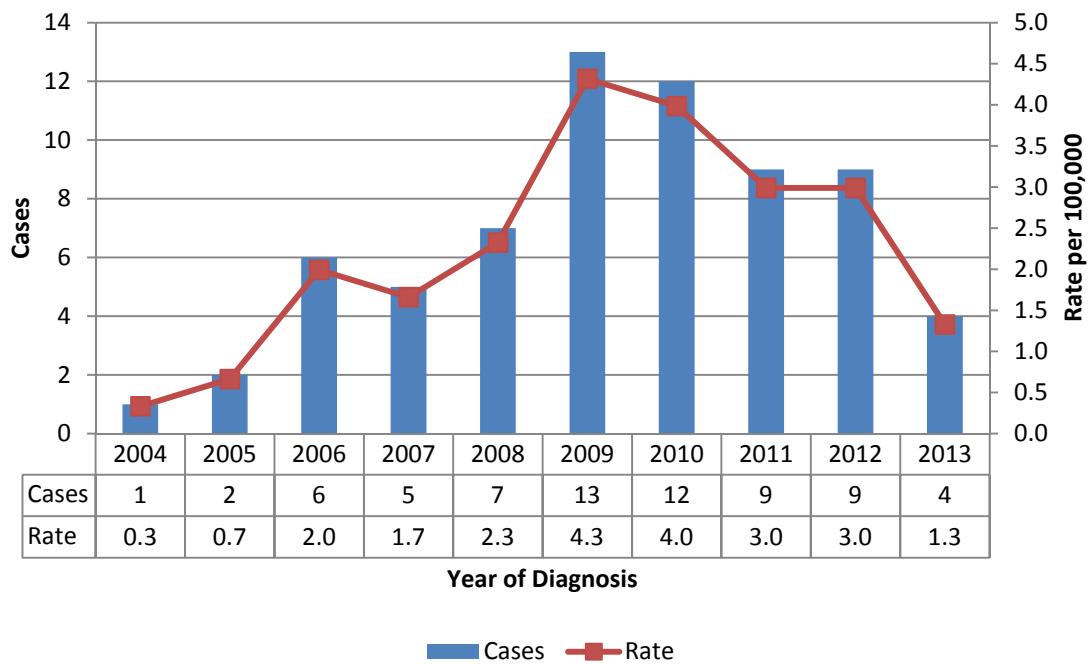

Alabama's population can be divided into three geographical groupings: major urban centers (>200,000 population), minor urban centers (100,000-200,000 population), and rural areas (<100,000 population). Major urban centers include Jefferson, Madison, Mobile, and Montgomery Counties. According to the 2010 U.S. Census, these major urban centers represented 34% (1,635,632) of the State's total population. In 2013, the major urban centers represented 48% (18768) of cumulative STD cases reported to ADPH.

Alabama is a rural state where 55 of the 67 counties are located outside of the State's major population centers. Rural areas accounted for 25% (4256) of cumulative HIV cases. Alabama is considered primarily rural with 55 of the 67 counties located outside of the state's major and minor urban population centers. Alabama's rural populations represent 32% of all STD cases and 41% of the State's total population.
