The Diabetes Branch addresses the impact of diabetes in Alabama by developing policies, recommendations, and programs about the disease and related issues. The program is funded through a grant from the Centers for Disease Control and Prevention (CDC). The Alabama Diabetes Network, formerly the Diabetes Advisory Council, is composed of many advocates and experts representing the public and private sectors. The American Diabetes Association reports that more than 24 million people in the United States have diabetes. At least 57 million people in the United States have what is referred to as “pre-diabetes.”

According to 2007 Behavioral Risk Factor Surveillance System (BRFSS) data, more than 360,912 people in Alabama are aware they have diabetes. In addition, as many as 200,000 more may have diabetes and not know that they have it. Overweight and inactive individuals increase their risk of developing type 2 diabetes.

Almost 1 in 10 adults have been diagnosed with diabetes. Alabama is ranked fifth in prevalence of diabetes in the United States and its territories.
The 2007 BRFSS and other data sources show that Alabama has an extremely high incidence of diabetes and obesity, especially in African Americans. Although only about 25.4% of Alabama’s population is African American, more than 30.0% of diagnosed diabetes cases are reported in that group (2007 BRFSS). Data also show that while 9.4% of white adults report having diabetes, the rate is 12.5% in African Americans. The prevalence of diabetes is highest among those aged 65 and older. This trend has been consistent over the past decade.
The 2007 BRFSS is the first year diabetes data by public health area is available for Alabama.
Only 20 percent of Alabamians met the recommended level of vigorous activity.

Nearly 30 percent of Alabamians met the recommended level of moderate physical activity.

Diet and physical activity are important factors in order to reduce prevalence of diabetes. Across public health areas fruit and vegetable consumption among adults was low. Today Type 2
diabetes is affecting Alabama’s youth.

Consumption of fruits and vegetables among youth is low in Alabama. Physical activity is also low.

Behaviors such as smoking increase complications suffered by persons with diabetes. According to the 2007 BRFSS, there are 786,383 (22.49%) current smokers in Alabama, 194,957 (25.33%) of current smokers are obese (BMI >30), and 63,623 (8.13%) current smokers are diabetics. Diabetes is the seventh leading causes of death and it may contribute to heart disease stroke, pneumonia and other causes of death.

We provided diabetes mortality by county.
The financial burden of diabetes in the United States is more than $132 billion per year.

- In 2002, the per capita costs of health care for people with diabetes were $13,243 compared to $2,560 for people without diabetes.
- In Alabama, the annual economic cost of diabetes is estimated to be over $2 billion.
- In 2007 9.54% of persons with diabetes reported that they were not covered by any health plan.
- 18.34% indicated that at some time within the past 12 months they had not been able to afford a visit to the doctor.

The Office of Disease Prevention and Health Promotion, US Department of Health and Human Services’ national **Healthy People 2010** goal for Alabama includes:

- Reducing Alabama’s diabetes death rate to 14.5 percent per 100,000 persons; and
- Increasing to 75 percent or more the percentage of adults aged 18 and older with diabetes who have had a dilated eye exam within the past year.

The Alabama Diabetes Prevention and Control Program works with the Alabama Diabetes Network to promote systems change and create healthy communities. Our focus has been placed on improving education, access to care, and quality of life through the following areas:

- Reducing the incidence and complications of diabetes and obesity
- Reducing health disparities in racial and ethnic populations impacted by diabetes and obesity
- Identifying and implementing the best prevention practices
- Improving public awareness and patient understanding of diabetes and its control
- Promoting educational opportunities to provide better self-management of diabetes
- Improving access to diabetes information
- Improving health care providers' understanding of diabetes and the control and adoption of best practices
- Advocating for policies that promote the prevention of diabetes and improve the quality and access to diabetes care
Activities

Communications

- Using our Speakers Bureau, radio, media announcements, newsletters, Web site as resources
- Including the state diabetes resource directory and burden report on the Web at (www.adph.org/diabetes)
- Offering health literacy information to healthcare providers

Schools

- Supporting healthy snacks and physical activity initiatives
- Providing educational materials and technical assistance during collaboration meetings

Community

- Emphasizing diabetes health promotion, prevention, and protection activities
- Utilizing the American Diabetes Association’s Project Power to engage faith-based organizations in diabetes prevention activities
- Encouraging the establishment of Diabetes Today coalition building activities in communities throughout the state
- Supporting a network for community involvement in rural areas such as the Black Belt region of Alabama
- Encouraging partners to promote worksite wellness, smoking cessation, nutrition and physical activity initiatives
- Partnering with cooperative extension systems, parks and recreation, and faith-based organizations to build healthy communities
- Promoting National Diabetes Education Program community resources:

```
```

Health Care

- Training health care providers to improve patient caregiver communications
- Conducting satellite conferences for health care providers

Evaluation

- Utilizing existing data sources, such as the Behavioral Risk Factor Surveillance System and the Youth Risk Behavior Surveillance System, to identify and measure program outcomes and assess progress toward program goals.
- Encouraging the use of local systems which allow providers to interface assessments of HbA1c testing, foot exams, influenza and pneumonia vaccinations

Partnerships

- Continuing to add to the existing list of over 200 partners, and provide training and opportunities for networking
Current Practices

According to the 2007 BRFSS, 70.40% of diabetics conducted personal foot checks in 2007, 63.00% completed daily blood sugar checks, 50.70% had pneumonia vaccinations, 59.30% had flu shots, 80.10% had eye exams, 66.10% had their feet checked by healthcare providers, 73.20% received HbA1c tests and 48.90% received diabetes education.

The objectives of the Diabetes Branch are to expand partnerships and encourage partners to work together instead of working in silos. Everyone should feel ownership of community initiatives and accomplishments. Emphasis is placed on the establishment of community awareness and evidence-based programs to create viable diabetes related health prevention and promotion activities. The goal is to influence all people to make and sustain appropriate lifestyle changes. We invite all agencies, communities, organizations, policy makers, and individuals to join us in the effort to create a healthier Alabama!

Desired Outcomes
