**PHARMACIST** Guidelines for Ebola

What to do if a sick patient comes to the pharmacy

## 1. Evaluate the Patient

Does the patient have the following symptoms<sup>1</sup>:

- Fever (>38C / 100.4F)
- Severe Headache
- Muscle Pain

- Vomiting/Diarrhea
- Abdominal Pain
- Unexplained Hemorrhage

Does the patient meet the following high risk exposure criteria:

- Travel to West Africa (Guinea, Liberia, Senegal, Sierra Leone or other countries where EVD transmission has been reported by WHO)
- Contact with blood or other body fluids of a patient with known or suspected Ebola infection
- Direct handling of bats or non-human primates from disease-endemic areas

# 2. If ØYES to BOTH Criteria

Limit exposure by keeping distance<sup>2</sup>

- Close contact is defined as prolonged exposure within 3 feet.
- Identify location to isolate patient while waiting for transport to hospital.
- While it's very unlikely that a symptomatic patient with Ebola would present to a pharmacy, ensure patient is kept at least 3 feet away from customers and staff.

#### Refer patient to hospital emergency room and notify ADPH<sup>3</sup>

- Alabama Department of Public Health (ADPH) phone number: 1-800-338-8374. The Health Department will notify CDC.
- Complete EVD Consultation Record (http://www.adph.org/ebola/assets/AL\_EVD\_Consultation\_Form.pdf) and fax to 334-206-3734 or email to CDFax@ADPH.state.AL.US.
- Compile a list of healthcare workers and patients that may have come in contact with the patient, along with their personal contacts.
- Review all contact with patient with the Health Department. They will evaluate and decide on further monitoring or testing<sup>4</sup>.
- Notify hospital emergency room before transport and arrange for transport via non-public transportation or ambulance.

# 2. If YES to BOTH Criteria (continued)

Notify your company Pharmacy District Manager or risk management program

• Name & phone number to contact: \_\_

### Disinfect surfaces, wash hands thoroughly with soap and water

- Use 10% bleach or disinfectant that is labeled as effective against unenveloped viruses such as Norovirus<sup>5</sup>.
- Limited studies have shown that regular cleaning in a healthcare setting results in undetectable viral RNA on surfaces even during an active outbreak response<sup>2</sup>.
- If cleanup of bodily fluids is required, ensure that safe procedures are used<sup>6</sup>.
  - 1. Block off the area until cleanup and disinfection is complete. No visitors or unprotected staff members should be able to access the area.
  - 2. Use appropriate personal protective equipment (gloves, gown, eye protection, face shield).
  - 3. Wipe up the bodily fluids as much as possible with paper towel or other absorbent material.
  - 4. Gently pour disinfectant (or 10% bleach solution) onto all contaminated areas.
  - 5. Let disinfectant remain on contaminated area for 20 minutes and then wipe up remaining bleach solution.
  - 6. Remove gloves and place in a biohazard bag with all other soiled cleaning materials.
  - 7. Double bag and secure biohazard bags in a puncture-resistant container. This material is considered hazardous material and must be transported and discarded properly<sup>7</sup>.
  - 8. Thoroughly wash hands with soap and water.

## 3. Additional Resources - Stay Informed
